My Goal

Oscillations of a Water Balloon

Sven Isaacson

Background

Young-Laplace Eqn

Deriving a Boundary Condition

Computing the solutions and eigenfrequencies

Closing Remarks

- To model the waves which form on the surface of a water balloon impinging on a surface
 - Look at acoustic (pressure) waves created within the water balloon
 - Look at waves formed from deformation of the balloon surface

Figure : Waves formed on a water balloon surface

Update

Oscillations of a Water Balloon

Sven Isaacson

Background

Young-Laplace Eqn

Deriving a Boundary Condition

Computing the solutions and eigenfrequencies

Closing Remarks

Figure : A travelling Gaussian isobar impinging from below a membrane

- Previous approach looked at an acoustic driving force driving oscillations on a membrane
- This is mathematically complicated: two coupled PDEs (the acoustic pressure wave, and the wave equation on the surface)
- Better approach: try modelling the surface force as the surface tension of a non-wetting droplet
- This is governed by the Young-Laplace Equation

Brief Review

Oscillations of a
Water Balloon

Sven Isaacson

Background

Young-Laplace
Eqn

Deriving a
Boundary
Condition

Computing the
solutions and
eigenfrequencies

Closing Remarks

Fluid mechanics: describe the velocity of "elements" of the fluid, \mathbf{u}

If irrotational flow: $\nabla \times \mathbf{u} = 0$, therefore $\mathbf{u} = \nabla \phi$

is called the **velocity potential** and it satisfies Laplace's Equation

$$\nabla^2 \phi = 0$$

Goal: Solve the Laplace equation for the a droplet.

- Velocity potential of fluid at surface of balloon will give velocity of balloon surface
- Need a boundary condition to solve the Laplace Equation

Young-Laplace Equation

The Young-Laplace Equation describes the pressure difference at the surface between two fluid media:

$$p =$$

- $p = p_1 - p_2$ where p_1 is pressure in medium 1 and p_2 is pressure in medium 2
- is the surface tension (units J/m^2 or N/m)
-

Closing Remarks

A Slightly Deformed Sphere

Oscillations of a
Water Balloon

Sven Isaacson

Background

Young-Laplace
Eqn

Deriving a
Boundary
Condition

Computing the
solutions and
eigenfrequencies

Closing Remarks

Need to calculate the curvature of a sphere that is slightly deformed

Consider radius of slightly deformed sphere to be

$$r(\theta, \phi) = R + \delta r(\theta, \phi)$$

- R is the original radius
- δr is a small deviation from R

Figure : Near-sphere, with slight changes in radius

What is $\frac{1}{R_1} + \frac{1}{R_2}$?

Oscillations of a Water Balloon

Sven Isaacson

Background

Young-Laplace Eqn

Deriving a Boundary Condition

Computing the solutions and eigenfrequencies

Closing Remarks

Can be calculated by equating the infinitesimal change in the surface area

$$A = \iint \left(\frac{1}{R_1} + \frac{1}{R_2} \right) dA$$

{ small change in radius.

Alternatively, calculating the surface area of the deformed sphere:

$$A = \iint (R + \delta r)^2 \sqrt{1 + \nabla^2 r} dA$$

which for small change becomes

$$A = \iint \left(\frac{2}{R} \delta r - \frac{2}{R^2} \delta r^2 - \frac{1}{R^2} \delta r^3 + \frac{1}{\sin^2 \theta} \frac{\partial^2 \delta r}{\partial \theta^2} + \frac{1}{\sin \theta} \frac{\partial \delta r}{\partial \theta} \right) \sin \theta dA$$

equating the integrands we get...

Surface Pressure and Fluid Pressure

Oscillations of a Water Balloon

Sven Isaacson

Background

Young-Laplace Eqn

Deriving a Boundary Condition

Computing the solutions and eigenfrequencies

Closing Remarks

Young-Laplace Equation becomes

$$p = p_f - p_{air} = \frac{2}{R} - \frac{2}{R^2} - \frac{1}{R^2} \frac{1}{\sin} \frac{\partial}{\partial} \sin \frac{\partial}{\partial} + \frac{1}{\sin^2} \frac{\partial^2}{\partial^2}$$

■ p_{air} is constant, ambient

■ $p_f = - \frac{\partial}{\partial t}$

At the surface $\partial = \partial t = \partial = \partial r$. Differentiate the above w.r.t. time and substitute:

The boundary condition

$$\frac{\partial^2}{\partial t^2} - \frac{2}{R^2} \frac{\partial}{\partial r} + \frac{\partial}{\partial r} \frac{1}{\sin} \frac{\partial}{\partial} \sin \frac{\partial}{\partial} + \frac{1}{\sin^2} \frac{\partial^2}{\partial^2} = 0$$

Contact Pressure

Oscillations of a
Water Balloon

Sven Isaacson

Background

Young-Laplace
Eqn

Deriving a
Boundary
Condition

Computing the
solutions and
eigenfrequencies

Closing Remarks

The pressure on the surface isn't p_{air} at every point of the sphere. At the bottom there is a Dirac delta pressure

$$P_f = (r = R; \quad ; \quad = 0)$$

this changes the boundary condition equation (adds an extra term)

Figure : A sphere droplet resting on a plane

Solution of Laplace's Equation

Oscillations of a
Water Balloon

Sven Isaacson

Background

Young-Laplace
Eqn

Deriving a
Boundary
Condition

Computing the
solutions and
eigenfrequencies

Closing Remarks

Look for a solution

$$= \exp(-i\omega t) f(r; \theta)$$

so

$$\nabla^2 = 0$$

$$\nabla^2(\exp(-i\omega t) f(r; \theta)) =$$

$$\exp(-i\omega t) \nabla^2 f(r; \theta) =$$

$$\nabla^2 f(r; \theta) = 0$$

so f must solve Laplace's Equation.

Spherical Harmonics

Oscillations of a
Water Balloon

Sven Isaacson

Background

Young-Laplace
Eqn

Deriving a
Boundary
Condition

Computing the
solutions and
eigenfrequencies

Closing Remarks

Plugging in our solution

The boundary condition

$$\frac{\partial^2}{\partial t^2} - \frac{1}{R^2} \left(2 \frac{\partial}{\partial r} + \frac{\partial}{\partial r} \frac{1}{\sin \theta} \frac{\partial}{\partial \theta} \sin \theta \frac{\partial}{\partial \theta} + \frac{1}{\sin^2 \theta} \frac{\partial^2}{\partial \phi^2} \right) = 0$$

with

$$= \exp(-i\omega t) r^l Y_{l,m}(\theta, \phi)$$

reduces to

$$l^2 = \frac{l(l-1)(l+2)}{R^3}$$

or, when the expansion of the contact force is included

$$l^2 = \frac{l(l-1)(l+2)}{R^3 \left(1 + \frac{\rho}{(2l+1)4} \right)}$$

Summary

Oscillations of a
Water Balloon

Sven Isaacson

Background

Young-Laplace
Eqn

Deriving a
Boundary
Condition

Computing the
solutions and
eigenfrequencies

Closing Remarks

- Surface effects should be treated as surface tensions, to avoid two coupled PDEs
- Young-Laplace equation governs pressure differences caused by surface tension
- The Y-L equation can be used to get a boundary condition of the Laplace equation for fluid velocity potential

Conclusions

Oscillations of a
Water Balloon

Sven Isaacson

Background

Young-Laplace
Eqn

Deriving a
Boundary
Condition

Computing the
solutions and
eigenfrequencies

Closing Remarks

There are some problems with this model

- Applied pressure is not just at a point, but grows with time
- Difficult to determine "surface tension" of a balloon { wouldn't expect this to be equal to the elastic tension
- This theory is for *small* droplets for which gravity is negligible to capillary action

However, this my best attempt yet

- Neatly ties together the surface term and the internal velocity field
- Reduces to the easily solved Laplace equation, for the velocity potential

Future Work

Oscillations of a
Water Balloon

Sven Isaacson

Background

Young-Laplace
Eqn

Deriving a
Boundary
Condition

Computing the
solutions and
eigenfrequencies

Closing Remarks

- Account for gravity waves in the water balloon
- Treat contact force as an expanding area as a function of time, rather than point
- Compare measured values to predicted
